The maximum combined input solar power allowed for this controller is 260W for a 12V battery system or 520W for a 24V system. In particular, this controller will significantly increase efficiency of a solar system where the solar panel voltage is much higher than the battery voltage (e.g. charging a 12V battery with a 36V solar panel).

Since Solar is an intermittent power generation, functioning on the average 17% -22%, this renewable electricity has to be backed by base load, mostly "dirty" energy that has to be available 24/7 to balance the solar power generation, in order not to damage transformers, how do we actually come up with the real cost per kWh for the solar generation?

## 520w solar power generation

Typically, a modern solar panel produces between 250 to 270 watts of peak power (e.g. 250Wp DC) in controlled conditions. This is called the "nameplate rating", and solar panel wattage varies based on the size and efficiency of your panel. There are plenty of solar calculators, and the brand of solar system you choose probably offers one.
