Sodium-ion is one technology to watch. To be sure, sodium-ion batteries are still behind lithium-ion batteries in some important respects. Sodium-ion batteries have lower cycle life (2,000-4,000 versus 4,000-8,000 for lithium) and lower energy density (120-160 watt-hours per kilogram versus 170-190 watt-hours per kilogram for LFP).

The first rechargeable lithium battery was designed by Whittingham (Exxon) and consisted of a lithium-metal anode, a titanium disulphide (TiS_2) cathode (used to store Li-ions), and an electrolyte composed of a lithium salt dissolved in an organic solvent. 55 Studies of the Li-ion storage mechanism (intercalation) revealed the process was highly reversible due to ...

Lithium iron phosphate (LFP) and lithium nickel manganese cobalt oxide (NMC) are the two most common and popular Li-ion battery chemistries for battery energy applications. Li-ion batteries are small, lightweight and have a high ...

The Li-ion battery is classified as a lithium battery variant that employs an electrode material consisting of an intercalated lithium compound. The authors Bruce et al. (2014) investigated the energy storage capabilities of Li-ion batteries using both aqueous and non-aqueous electrolytes, as well as lithium-Sulfur (Li S) batteries.
