Solar cells are the electrical devices that directly convert solar energy (sunlight) into electric energy. This conversion is based on the principle of photovoltaic effect in which DC voltage is generated due to flow of electric current between two layers of semiconducting materials (having opposite conductivities) upon exposure to the sunlight [].

Photovoltaic cells are semiconductor devices that can generate electrical energy based on energy of light that they absorb. They are also often called solar cells because their primary use is to generate electricity specifically from sunlight, but there are few applications where other light is used; for example, for power over fiber one usually uses laser light.

1839: Photovoltaic Effect Discovered: Becquerel's initial discovery is serendipitous; he is only 19 years old when he observes the photovoltaic effect. 1883: First Solar Cell: Fritts' solar cell, made of selenium and gold, boasts an efficiency of only 1-2%, yet it marks the birth of practical solar technology. 1905: Einstein's Photoelectric Effect: Einstein's explanation of the ...
