

I would think these are one of the first li-ion 18650-cells (1st generation) from Panasonic which could mean, that their stock IR could be very high (>=80-90), but without data from others or a more detailed spec-sheet, I can not use them without concerns. (They are not heaters at 750mA charging).

Slight clarification. The OP asked about a panel config rated for 21.7a - e.g. 2p. But the charge controller unit has a 18a max input. I'm not saying the panels would produce more than 21.7a but that they could produce up to 21.7a if ...

Warning: The information in this thread was obtained from various sources on the Internet, including any datasheets linked below, and is provided for reference only is not guaranteed to be accurate. To prevent fire or personal injury, never charge or discharge a cell before verifying the information yourself using the original specifications sheet provided by the ...

For those interested in IR and wanting to know what a "good" IR is for various cells I've put together the following table. This was built from a combination of Wolf, 100kWh Hunter, and my own data. All IR measurements were taken with a 4-wire Kelvin type AC 1kHz impedance tester, specifically...

Soldering iron: 70W Taiyo ElectricPX-401, set to ~390C,with 5mm diameter"large tip for high thermal-storage", but cut at an angle to allow pointed contact. Solder: Standard 60/40 rosin core, 1mm diameter I think this technique works well, because: 1) The rosin has no time to boil away and gets to work immediately, maximizing its effectiveness

The life cycle is not a linear line. It's more like a curve. Without knowing where at on the curve in life cycles, you can't predict how many are left based on the mAh the cell charges to. There are many cells that have had an easy life, gone through 100's of cycles, and still perform 80% of their rated capacity.

The first row is the average of Cycles 1-5 and the second row is the average of Cycles 201-205 for each cell. The third row shows the percentage of degradation of each cell. Please keep in mind that the LG cell did not start out this test as a new cell, and already had a number of cycles or cycle equivalents on it before the test got started.

I have a few hundred Headway LFP cells that I tested for capacity and IR. I want to make some 4S battery banks for car audio. I would like to make some different ah configurations probably from 16ah (2P) all the way up to 96ah (12P), but for now let's assume I'd like to just make some 48ah...

I've actually had good success bringing 0v cells back to life. I first started by paralleling a good with a bad for 20 seconds, then on the D4. ... End game is to feed 100% of house solar to the grid and use second system for household usage with the added benefit of having power during outages. I'll have to look at grid backup and battery ...

And since you are new here, it may be tempting to buy some high capacity 18650's online for real cheap. Be aware, there are absolutely zero 18650, 25650, or similarly sized cells that are higher capacity than 3500-4000mAh. They are scams. And anything that has the word "Fire" in the name, take that as a warning not a name.

Thanks very much for this information. I recently got about 150 of these cells. Most tested in the 1400-1700 mAh range. Now I can check to see if they are still reasonable cells (G3-G5), or well used and closer to end of life (G6+).

So I have been collecting, stripping, cleaning, charging, storing and testing 18650's till all I see when I close my eyes is 18650's My plan is to build 2 x 7S80P (>1800mah per cell)banks and hook them up to my Axpert 3KVA inveter and replace my 6 x 100ah lead acid's. Here are a few pic's of...

Samsung ICR 18650 26D Panasonic CGR18650E The Samsung cells I have had very good success rate, most are testing to be over 2500mah, so practically new. The panasonic cells come in second. Their cells have tested every single time to be above 2000mah per cell, with none going below that. The sanyo cells come in third.

Sony VTC5 or US18650VTC5 is a 2600mAh 18650-size Li-ion cell which supports continuous discharge at up to 30A with 80C temperature cut or up to 20A with no temperature control. ... (Singapore). Sony VTC5's main specifications according to its datasheet (pdf): ... Cycle life: After 300 cycles at ...

6kWh / 3kW 2nd Life Energy Storage System. This specification is for comparison purposes only. Limited Availability from end Q2 2024. Cell Type: 18650 Lithium Ion. Cell Make: Various - 2nd life tested. Cell Output: 3.7V@ 2.0Ah - 7 watts. ...

Regular 18650's won't discharge as much as Vape batteries, and that's actually a good thing. When you have 100 cells in parallel, you can easily hit 100A with "old crap" @1A each. With Vape batteries, that could be 2000A which is overkill and I'm guessing that Vape batteries don't last as long as 18650's but I could be wrong.
