

Shared energy storage power station project introduction

What is energy storage/reuse based on shared energy storage?

Energy storage/reuse based on the concept of shared energy storage can fundamentally reduce the configuration capacity, investment, and operational costs for energy storage devices. Accordingly, FESPS are expected to play an important role in the construction of renewable power systems.

What time does the energy storage power station operate?

During the three time periods of 03:00-08:00, 15:00-17:00, and 21:00-24:00, the loads are supplied by the renewable energy, and the excess renewable energy is stored in the FESPS or/and transferred to the other buses. Table 1. Energy storage power station.

What is the operation process of power flow regulation and shared energy storage?

The operation process of power flow regulation and shared energy storage of bus 1 after obtaining the solution to the bilevel optimization operation model is depicted in Fig. 9. During the periods of 01:00-05:00 and 23:00-24:00, the load is jointly supplied by the power flow transfer and the superior power grid.

Should energy storage power stations be scaled?

In addition, by leveraging the scaling benefits of power stations, the investment cost per unit of energy storage can be reduced to a value lower than that of the user's investment for the distributed energy storage system, thereby reducing the total construction cost of energy storage power stations and shortening the investment payback period.

Why should power grid enterprises use multi-point centralized energy storage stations?

For power grid enterprises, multi-point centralized medium and large-scale energy storage stations will be conducive to the reinforcement of the distribution network and the sustainable consumption of renewable energy.

How can flexible shared energy storage improve the energy consumption capacity?

After connecting the buses 1-4 to the flexible shared energy storage equipment, the source load matching optimization of the four lines corresponding to the buses can be coordinated through the flexible shared energy storage, which can significantly improve the consumption capacity for the newly generated energy.
