

The minimal ratio of accumulators to solar panels is 0.84, any less and it will not store enough for the night So the minimum to keep the radar running at all times is: $5 / 0.7 = 7.142 \approx 8$ Solar panels $7.142 * 0.84 = 6$ (wow a whole integer) accumulators Adding any more will do nothing. ...

Just remember that the factory can only use 70% of power produced by a solar panel, the rest needs to be set aside for accumulation. The vanilla ratio is 25:21 (60kw panel, 5MJ accumulator). A factory pulling a constant 4.2MW (70% of 100 solar panels), needs 84 accumulators or 420MJ. Krastorio 2 buffs solar panels to 100kw and accumulators to 10MJ.

I tried it out in sandbox mode (with Krastorio 2), and it seems correct. 20 regular solar panels (or 8 advanced solar panels) combined with 14 (200.7) accumulators gave a stable 1.4MW for 35 sentinels (3520KW = 1.4MW). And each cycle, the accumulator charge ...

$37/13 = 2,846$ accumulators / solar panel. Following the math from this forum thread with the values you gave I found a ratio of exactly 2.8 accumulators per solar panel, pretty close to what you got and yeah, wildly different from vanilla.

I found somewhere the solar/accumulator ratio but that was for a 0 consumption scenario. Uhh nope, you

don't need any accumulators for a zero consumption scenario. The 21:25 ratio comes from the fact that solar panels produce 60kW during the day and 0kW during the night (with ramps at dawn and dusk), giving 42kW per panel averaged across the ...

A single solar panel generates 360 kw during normal full sun operation. An Accumulator has a maximum in/out charge rate of 600 kw at a time. So the most balanced ratio is 3:5, three accumulators for every 5 solar panels. But you can also get away with a simple 1:2, one accumulator for every 2 panels if you don't feel like being that fiddly.
