This phase is where the physical solar panels and equipment are installed on-site and connected to the power grid. It includes several key steps that require careful planning and execution. Site Preparation. The first step in the construction phase is site preparation.

Simply put, off grid power is any alternative to mains grid connected power that allows you to operate normal 230-240V appliances in a residential or business environment. It could be a smokey old generator, solar, hydro, wind - or a mixture.

Sometimes, if generation is less than consumption, the only way to keep an off-grid power system operating is by using an engine generator. However, many generators are poorly matched to the job, resulting in inefficient, unreliable performance. It's important to choose the right unit for the job.

The low-voltage distribution box entrance of each building serves as a power grid and network, transmitting electricity through low-voltage lines into the surrounding grid. 4.2 Construction of electric power marketing system 4.2.1 Improve the management mode under the marketing system
